

PDF reDirect

Visit <http://www.exp-systems.com> for the free version of PDF reDirect, a program that will enable you to convert documents you have created (using your Word, Excel and perhaps other programs you own) or some internet pages into a pdf file.

The site is very open and honest about the difference between the free version and the upgraded version you pay for, and is not trying to trick you - pretty simple. If CNET.Download or Tucows are ever sites you can choose for the download, they are honest sites with a good reputation.

Portable Document Format is the filetype you view using Adobe Acrobat Reader, which everyone has or can get for free. A file in this format is like a snapshot of your original document, so that anyone looking at it sees the exact same thing, no matter what equipment they have, what fonts they have loaded, what margin settings they have, So, it is perfect for sending resumes electronically. It's also great for saving items you only have one opportunity to print when you are not near a physical printer (for instance, test results, online confirmations). You save the pdf and can print it when you are attached to a physical printer.

Once you install the program, here's a quick way to use it. There may be other ways to find by learning more about PDF reDirect, but this way works with any PDF converter that may already be installed on your machine.

Open your document (say, your resume in Word). Go to File->Print (or Ctrl+p or Ctrl+P) to bring up the printer dialog box. In this box, you will see a drop-down-menu arrow next to the name of your printer. In this drop-down-menu will be a pdf-maker listed along with any other printers you may have installed on this PC. Choose the pdf-maker, and hit OK down where you'd usually be saying "OK, go ahead and send this doc to the printer." Your file will be sent, not to the printer, but to the software you have chosen, probably PDF reDirect. That software will open up and will convert the file from doc (or xls or html or...) to pdf. Somewhere on that screen will be a place for you to tell the pdf-maker (1) what name to give the file if you don't want the name it chooses and (2) where that file should be stored. You would then browse to wherever you want to look for the file - I like Desktop. Otherwise, it's likely to be in ...\\Program Files\\pdf maker software name\\new files\\... some place you are not likely to quickly stumble upon! Many pdf-makers have a handy checkbox to display the new doc in Adobe Acrobat Reader. It's easy - really - try it.
